

## ***Help me write*** by Google([Source](#))

Recently, Google has unveiled a new NLP feature called "Help me write" that creates emails for users. This functionality is now being made available to a restricted group of Google users, such as Google's testers, and will shortly be made public. *Help me write* is an NLP tool incorporated into Gmail and Google Docs that will assist users in composing emails and writing sections based on the limited user provided inputs. It is an extension of the existing Smart Reply and Smart Compose sentence autocomplete features available in Gmail. It uses Google's large language model to compose text, which can also be modified further to suit different other tones. The main three tones available are Formalise, Elaborate and Shorten. Thus, this tool makes it easier to generate, recreate, refine, or modify text with various tones that are appropriate for the situation and previous messages. For instance, using this function makes it simple to create follow-up emails, thank-you notes, emails requesting the return of travel tickets and so on. Making cover letters for job applications can also be quicker with the help of this feature.

*Help me write's* key advantages are increased productivity and time efficiency. This tool will aid both frequent email senders and inexperienced email writers by enhancing their writing skills while saving time. It offers suggestions such as pertinent phrases, persuasive and powerful language, and concise sentences that aid in avoiding grammar and spelling errors and ensure the desired message or idea is communicated properly. This tool also takes user feedback to enhance performance and keeps track of email templates, which allows users to stay organized. Overall, this tool makes it easier to compose emails within seconds in various tones, such as professional, catchy, or funky, with an improved correctness and clarity([Source\\_1](#)).

Help me write, as previously said, is an innovative writing tool that uses generative AI technology integrated into popular Google products like Docs and Gmail. It is quite simple to utilise once access to this feature is granted. After opening the Google Doc, simply select the "Help me write" link at the bottom of the page, enter a brief description of what needs to be written, and then select 'Create.' Depending on the user's preferences, manually edit the text or click 'Recreate.' When the user is satisfied, click 'Insert,' and the writings will be added to the document. For Gmail, open the application in web browser or mobile and start composing an email. Then enter the limited input text and click 'Create.' Similar to before, modify the generated content manually or use 'Recreate' to regenerate fresh text. Finally, click 'Insert' to add the text to the email. This is a short explanation of how this NLP tool functions. Help Me Write will shake up the writing tool industry and significantly reduce professional workloads([Source\\_2](#)).
